Onboarding Digital Coworker — Checkpoint Deliverable

Oct 14, 2026 · @Juan Carlos Giron Salazar

Executive summary

The Onboarding Digital Coworker receives a new hire (through the JobDiva start email or chat), detects what is missing or inconsistent, builds the case with the right paperwork, access and equipment, and presents it for approval; only then does it run simulated actions and follow up. **The Coworker chases the information, reminds and prepares; people decide and approve.**

This document answers the seven points of the October 14 checkpoint. It combines the Solution Intake, the session with the onboarding team (Tonya Ramirez), the checkpoint proposed by Viviana Gomez and her comments, the agent brief and the knowledge module specification.

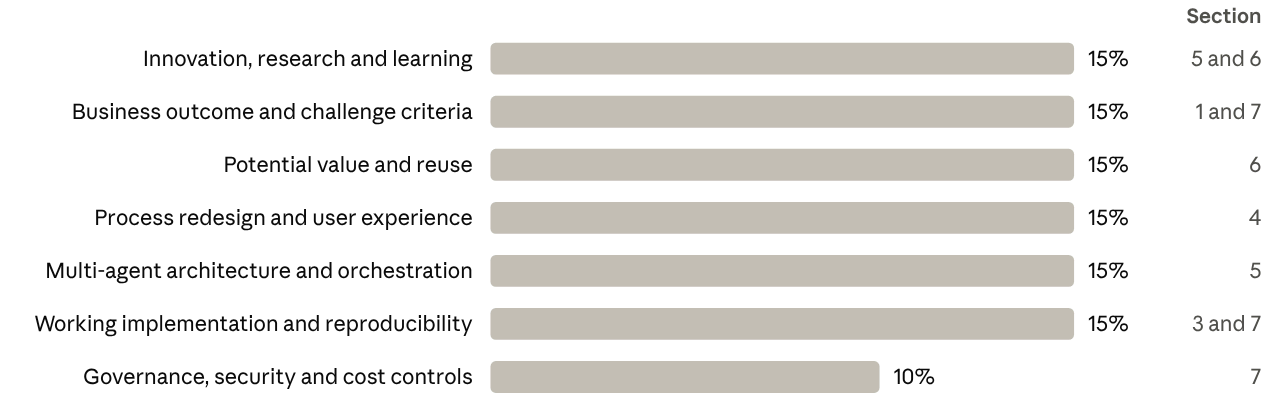

#	Checkpoint point	One-line answer	Section
1	Profile, mission, users and outcome	An onboarding assistant for INSPYR that cuts document onboarding from ~3 days to 1–1.5 days	1
2	Capabilities and responsibilities	9 Must, 5 Should and 4 Could, each with an owner agent and a human checkpoint	2
3	MVP scope	Intake, validation, package and approval with simulated actions; follow-up and the IGS handoff as extensions	3
4	Current and redesigned process	Validation moves from the end to the start; back-and-forth with the field disappears	4
5	Solution design	One Coworker for the user; inside, an orchestrator and seven specialized agents on Velocity 2.0	5

#	Checkpoint point	One-line answer	Section
6	Data, tools and integrations	Local web app; JobDiva, IT, equipment, payroll and email simulated; rules and knowledge as data	6
7	Governance, criteria, risks and plan	Seven human checkpoints, 12 acceptance criteria and submission on October 22	7

Confirmed decisions: business owner Tonya Ramirez; final submission on October 22; Tonya Ramirez, Consultant Onboarding Supervisor, approves the package; the IT team owns and approves equipment requests; the LDC team owns its tracker; the start email can be used in the sandbox; Teams is optional.

Six criteria weigh 15% and governance 10%; this document answers all of them

Weight of each evaluation criterion (total 100%) and the section of this document that answers it

Source: hackathon evaluationCriteria.md · 7 criteria

1. Digital Coworker profile

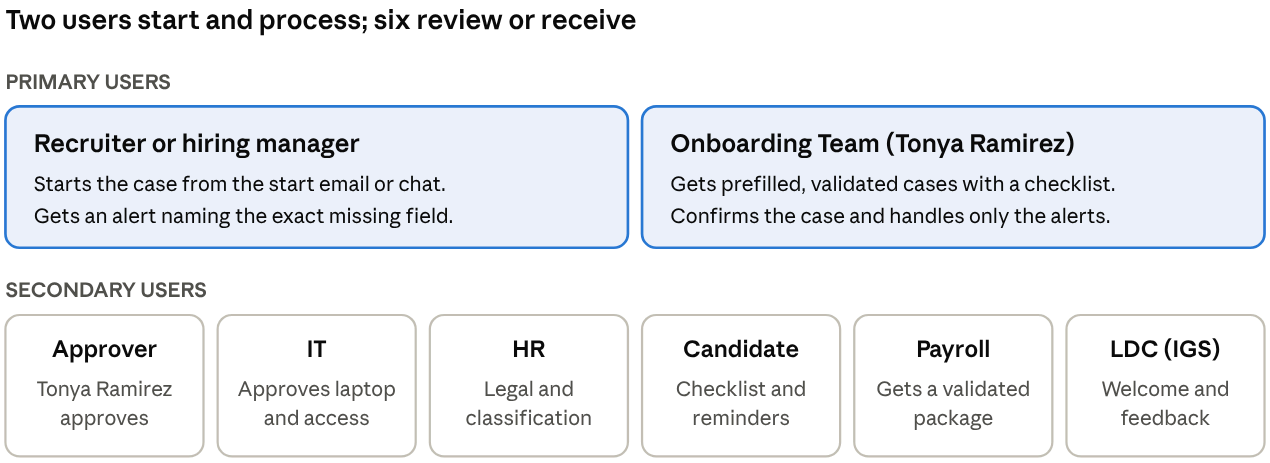

The Coworker is the single entry point to start an onboarding at INSPYR: it turns a new-hire notification into a complete, validated and approved case that each team can act on.

Item	Definition
Name	Onboarding Digital Coworker

Item	Definition
Mission	No team should have to chase information: the Coworker detects what is missing, asks the right person, reminds, validates and prepares; people decide and approve.
Reach	From the recruiting notification (or the manager's request) to approval and the resulting actions; as an extension, the handoff to IGS cultural onboarding.
Business owner	Tonya Ramirez, Consultant Onboarding Supervisor, INSPYR onboarding team
Platform	Velocity 2.0, local demo with simulated services
Principle	No action on systems, access, equipment or purchases without explicit human approval

Users

Eight user types interact with the Coworker; the two primary ones start and process the onboarding. To all of them it is one Coworker, with several touchpoints: email, chat and notifications.

Users · 2 primary, 6 secondary

User	Who	What they do with the Coworker
Onboarding Team	Tonya Ramirez and her team	Process the cases; an owner is assigned by client type and role
Approver	Tonya Ramirez, Consultant Onboarding Supervisor	Approves the onboarding package

Business outcome

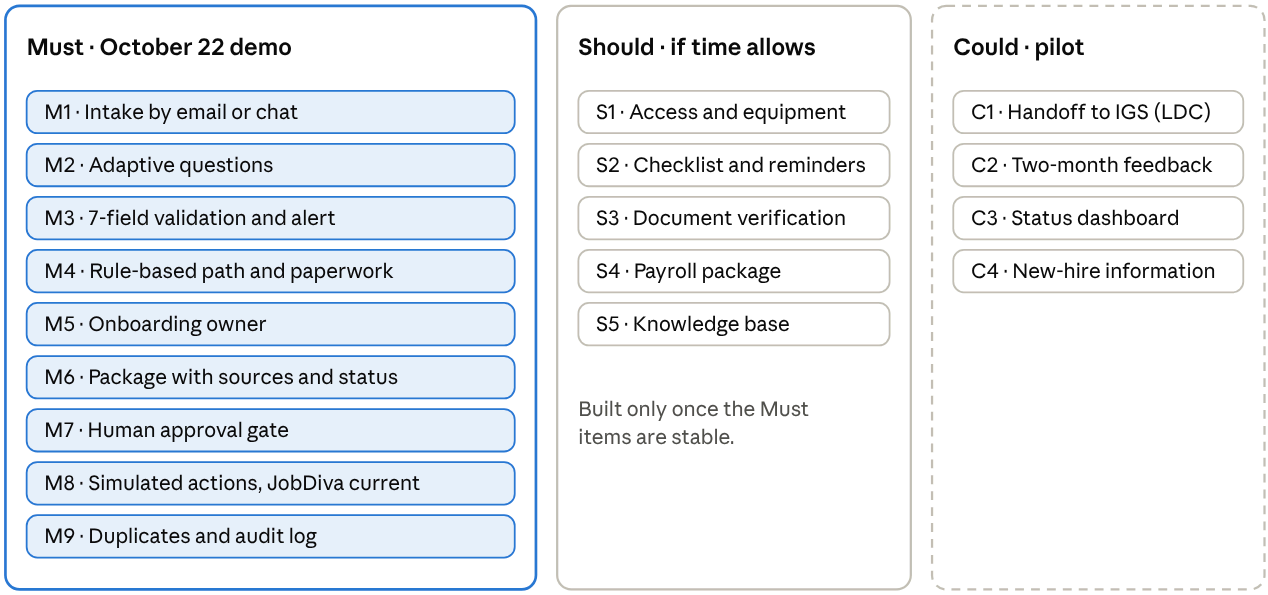

The main goal is to shorten document onboarding and get complete data on the first submission.

Metric	Baseline	Target	Measured in
Document onboarding time (receipt to documents complete)	~3 days	1 to 1.5 days	Pilot
Cases reaching onboarding with missing data and no alert	Frequent, not measured	0	Demo and pilot
Mandatory data complete in the test scenario	Not applicable	100%	Demo
Time from the last answer to a package ready for approval	Not applicable	5 minutes or less	Demo
Actions executed without approval	Not applicable	0	Demo
Payroll returns to onboarding	Not measured	Measurable reduction	Pilot
Business reviewer score	Not applicable	4 out of 5 or higher	Demo

2. Prioritized capabilities and responsibilities

The 9 Must capabilities make up the October 22 demo; the Should items are built if the Must items are stable, and the Could items stay as extensions or pilot work.

Nine Must capabilities make the demo; nine more are extensions

Priorities · 9 Must, 5 Should, 4 Could

Human control. The Onboarding Team is the human control for path and paperwork, the package and the approval gate, and resolves process escalations; Tonya Ramirez, Consultant Onboarding Supervisor, approves the package.

ID	Priority	Capability	Owner agent	Human control
M1	Must	Intake from the JobDiva start email or from chat	Intake and Validation	Not applicable
M2	Must	Adaptive questions: only what the path requires	Intake and Validation	Not applicable
M3	Must	Completeness and consistency check of the 7 note fields, with an alert to the recruiter naming the exact field	Intake and Validation	The recruiter corrects
M4	Must	Path and paperwork: W-2, contractor or corp-to-corp; agreement by FLSA; forms by state, city and client	Policy and Case Setup	Onboarding Team

ID	Priority	Capability	Owner agent	Human control
M5	Must	Onboarding owner assignment by client type and role	Policy and Case Setup	The Consultant Onboarding Supervisor assigns
M6	Must	Approval package with the source of each data point and a status: ready, blocked or needs clarification	Orchestrator	Onboarding Team
M7	Must	Approval gate: approve, return or reject before any action	Orchestrator	Onboarding Team; the Consultant Onboarding Supervisor approves
M8	Must	Simulated actions: JobDiva case updated at each stage, requests and task list	JobDiva and Workflow	Only with approval
M9	Must	Duplicate prevention and audit log	Orchestrator	Not applicable
S1	Should	Access and equipment: email, Teams, apps, laptop, provider, 2% or 5% overhead and bill-back	Access and Equipment	IT approves the laptop
S2	Should	Candidate checklist and tiered reminders (24 h, 48 h, then escalation)	Candidate Follow-up	Onboarding handles escalations
S3	Should	Check of delivered documents against the checklist	Candidate Follow-up	Onboarding countersigns
S4	Should	Payroll package and payroll returns turned into tasks	JobDiva and Workflow	Onboarding approves the handoff
S5	Should	Knowledge base: answer with sources, propose drafts and log unresolved questions	Knowledge	The right person for the case validates

ID	Priority	Capability	Owner agent	Human control
C1	Could	Handoff to IGS: LDC tracker entry and welcome kit by contract	Culture and Belonging	LDC approves the kit
C2	Could	Leader feedback at two months and draft congratulation	Culture and Belonging	LDC approves the feedback
C3	Could	Dashboard of status, pending items and risks	Orchestrator	Not applicable
C4	Could	Company, client and role information package for the new hire	Culture and Belonging	Onboarding reviews

Who does what

The Coworker	People
Detects missing or inconsistent data and asks	Confirm the prefilled case
Recommends path, paperwork, access and equipment, citing the rule	Resolve process escalations (Onboarding Team)
Builds the package and the checklist	Approve, return or reject the package
Sends reminders and escalates past thresholds	Approve the laptop (IT) and the payroll handoff
Runs simulated actions only with approval	Approve the welcome kit and feedback (LDC)
Logs every action for audit	Maintain business rules and validate knowledge

3. Confirmed MVP scope

The MVP covers everything from a new hire's arrival until the approved case produces its actions; candidate follow-up and the IGS handoff are extensions if time allows.

Journey	Priority	What it shows
J1. Intake and validation	Must	The Coworker reads the start email (or receives “I want to hire John Agnitsch starting October 1”), extracts the data, detects gaps and inconsistencies and asks only what is needed
J2. Package, approval and actions	Must	It builds the package with sources; the Onboarding Team reviews it and the Consultant Onboarding Supervisor approves, returns or rejects it; only then are the JobDiva case, the requests and the task list created (simulated), and JobDiva is updated at each stage
J3. Follow-up and handoff	Should	Checklist and reminders to a synthetic candidate, document verification and payroll package
J4. Cultural handoff to IGS	Could	LDC tracker entry, welcome kit and two-month feedback cycle with accelerated timing

Data the intake must collect

Field	Rule	Source
Work city and state	Mandatory; where the consultant works, not where the position is based	Recruiter note
FLSA	Mandatory; exempt or non-exempt (set by the field or HR, never by the Coworker)	Recruiter note
Billing contact	Mandatory	Recruiter note
Timesheet approver	Mandatory	Recruiter note
Equipment (hardware tier)	Mandatory; if equipment is needed, provider INSPYR (2% overhead) or Apple Direct (5%)	Recruiter note

Field	Rule	Source
Sponsorship and visa	Mandatory; if INSPYR sponsors, current visa status	Recruiter note
Additional notes	Optional; passed to onboarding or back office	Recruiter note
Role, manager, start date, client, division, line of business	Mandatory	JobDiva or chat
Employment type and vendor company	Mandatory; W-2, contractor or corp-to-corp	JobDiva or chat
Work arrangement (onsite, remote or hybrid)	Mandatory; one answer for every record	Chat
Pay rate and bill rate	Mandatory	JobDiva
Email, applications and shipping address	If applicable	Chat

In and out of scope

In scope	Out of scope
Intake by email and chat with adaptive questions	Recruiting inside JobDiva before the notification
Validation of the 7 fields and consistency rules	Legal classification or compensation decisions
Rule engine: client, location and contract to documents, owner and kit	Background checks, drug screens, I-9 and E-Verify
Access, equipment, overhead and bill-back (Should)	Real equipment purchases or provisioning
Approval package and human gate	Payroll processes after the handoff
Simulated JobDiva, IT, equipment, payroll and email	Production JobDiva API and real data
Follow-up with a synthetic candidate (Should)	Real e-signature and legal validation of documents

In scope	Out of scope
Knowledge base with human validation (Should)	Consolidation of the company-wide talent database
Handoff to IGS with accelerated timing (Could)	Production rollout across all locations

Demo scenario

1. The start email arrives for a W-2 consultant in Philadelphia, with the timesheet approver blank and a contradictory work arrangement.
2. The Coworker alerts the recruiter with the two exact fields; the recruiter answers in the chat.
3. The Coworker recommends the paperwork (non-exempt agreement and Philadelphia forms), the owner and, if S1 is ready, email, apps and an INSPYR laptop with 2% overhead.
4. The Coworker notifies the Consultant Onboarding Supervisor of the new person so she can assign the follow-up owner.
5. The Coworker notifies the follow-up owner on the Onboarding Team and hands over the package with sources so they can approve the consolidated information.
6. The Onboarding Team can ask the Coworker at any time about the status of their candidates; the Coworker checks JobDiva and answers in the chat.
7. When it applies, the Coworker sends the request to IT to approve the laptop.
8. The Coworker creates the case in the JobDiva mock, the access and equipment requests and the task list; everything is logged and updated as each process completes.
9. A second attempt with the same person and date is blocked as a duplicate.

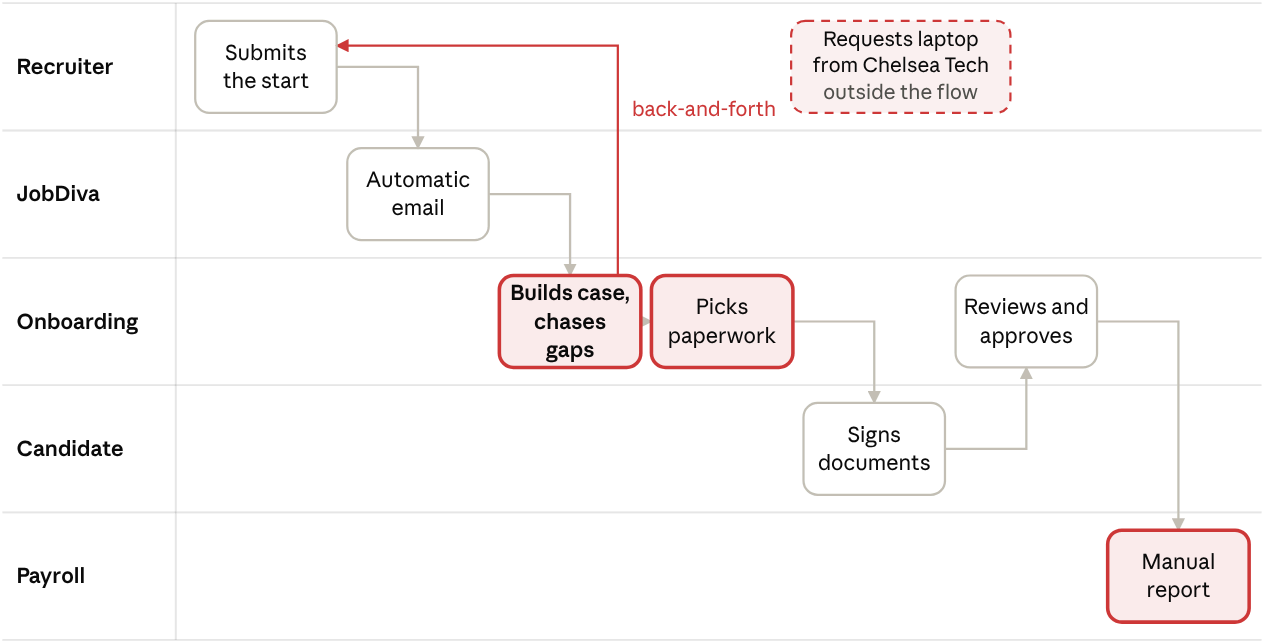

4. Current and redesigned process

The redesign moves validation to the start: today gaps are found once onboarding already has the case; with the Coworker, nothing reaches onboarding incomplete.

Current process (INSPYR)

Today, gaps are found once onboarding already has the case

Current INSPYR process by lane; in red, the pain points.

Current process · 5 lanes, 7 steps

Pain points

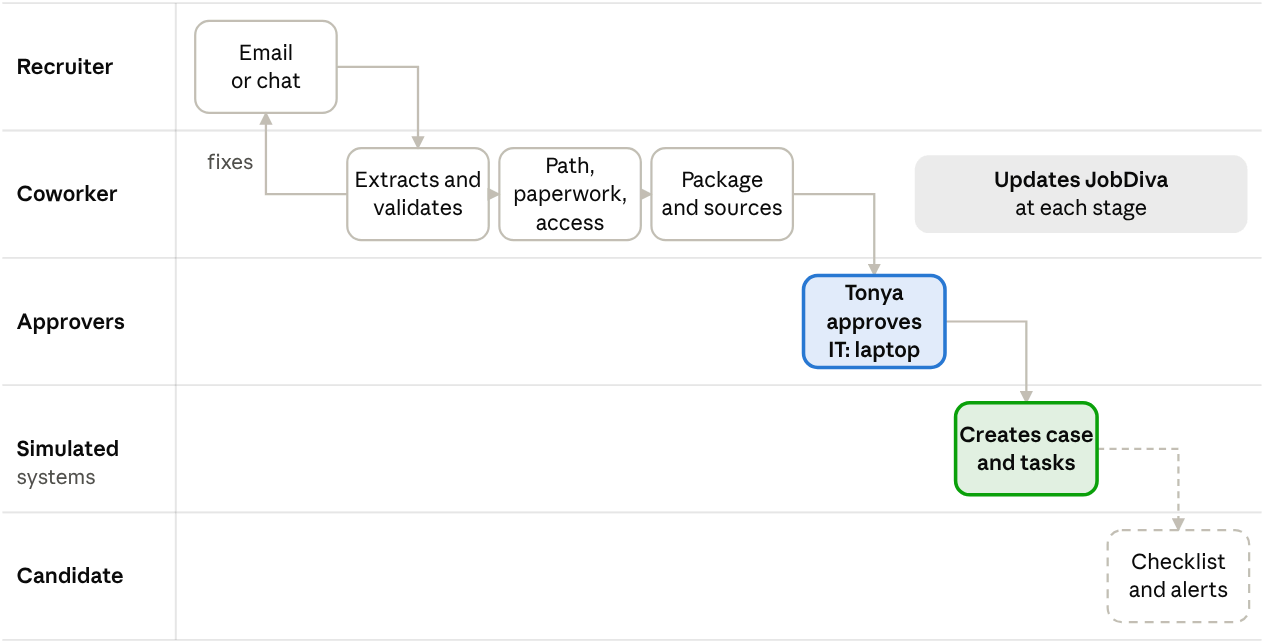

Pain point	Effect	How the Coworker solves it
Start notes are optional and arrive blank	Back-and-forth with the field before work can start	The 7 fields are validated on arrival and the recruiter gets the exact field
Work arrangement asked in three JobDiva places	Contradictory values	One confirmed answer feeds every record
Paperwork depends on tacit knowledge (FLSA, state, city, client)	Wrong or missing forms	A rule engine recommends and cites the rule
Cases created by hand and assigned by flagging emails by division	Repetitive work	Prefilled case and suggested owner

Pain point	Effect	How the Coworker solves it
Repeatedly checking JobDiva to see status	Lost time	Automatic reminders and alerts only when needed
Equipment requested from Chelsea Tech outside the flow	Overhead and bill-back missed	Equipment, provider and overhead in the same request, approved by IT
Manual payroll report reconciled with a Google Doc	Missed starts and returns	Payroll package and returns as tasks
Process knowledge held by a few people	Dependency and loss if someone leaves	Validated, searchable knowledge base

Redesigned process

With the Coworker, nothing reaches the approver incomplete

Redesigned process by lane. Blue = human decision; green = actions after approval; dashed = Should.

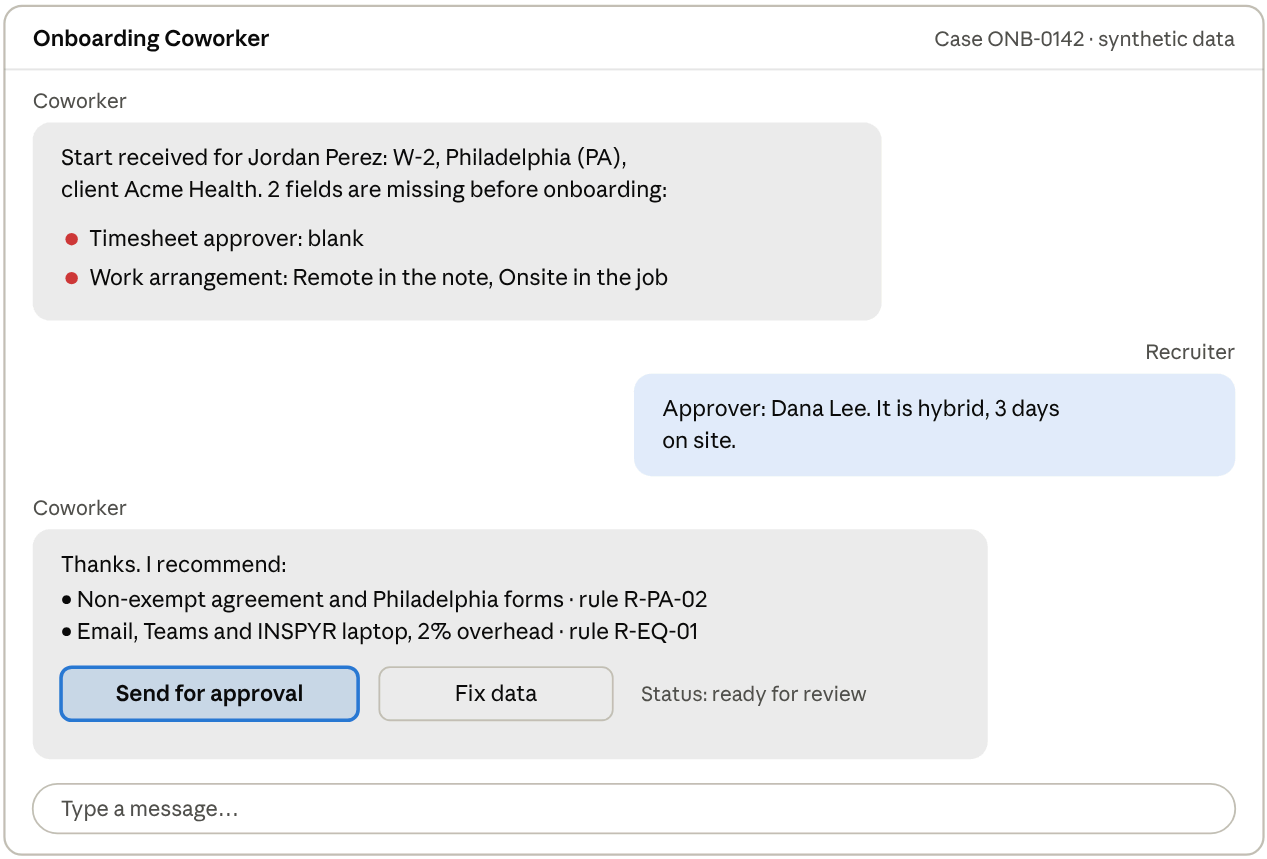

Redesigned process · 5 lanes, 7 steps

The recruiter fixes only the flagged field, before onboarding steps in. To every user it is one Coworker that keeps JobDiva updated at each stage; inside, each step is handled by a specialized agent. Nothing reaches any system without the Consultant Onboarding Supervisor's approval, and IT's when there is a laptop.

What the user sees

Two screens summarize the experience: the intake conversation and the package the approver reviews. The data is synthetic.

Mockup: the Coworker asks only for the two missing fields

Intake mockup · synthetic data, sample rules

Mockup: the approver sees every data point with its label and source

Approval package · ONB-0142 · version 2 — Ready for review

Jordan Perez · Data Analyst · Acme Health · starts Nov 1 · approves: Tonya Ramirez

Data	Value	Label	Source
Path	W-2 · non-exempt	Source	Recruiter note
Location	Philadelphia, PA · hybrid	Source	Recruiter, in chat
Timesheet	Dana Lee	Source	Recruiter, in chat
Paperwork	Non-exempt + PA forms	Recommended	Rule R-PA-02
Owner	Onboarding, Healthcare division	Recommended	Rule R-OWN-03
Access	Email, Teams, Office	Recommended	Access catalog
Equipment	INSPYR laptop · 2% overhead	Recommended	R-EQ-01 · IT approves
Bill-back	Does the client pay for the laptop?	Exception	No client rule

14 audit log events · 1 open exception · no duplicates

Approve | Return for correction | Reject | View in JobDiva ↗

Approval package mockup · synthetic data, sample rules

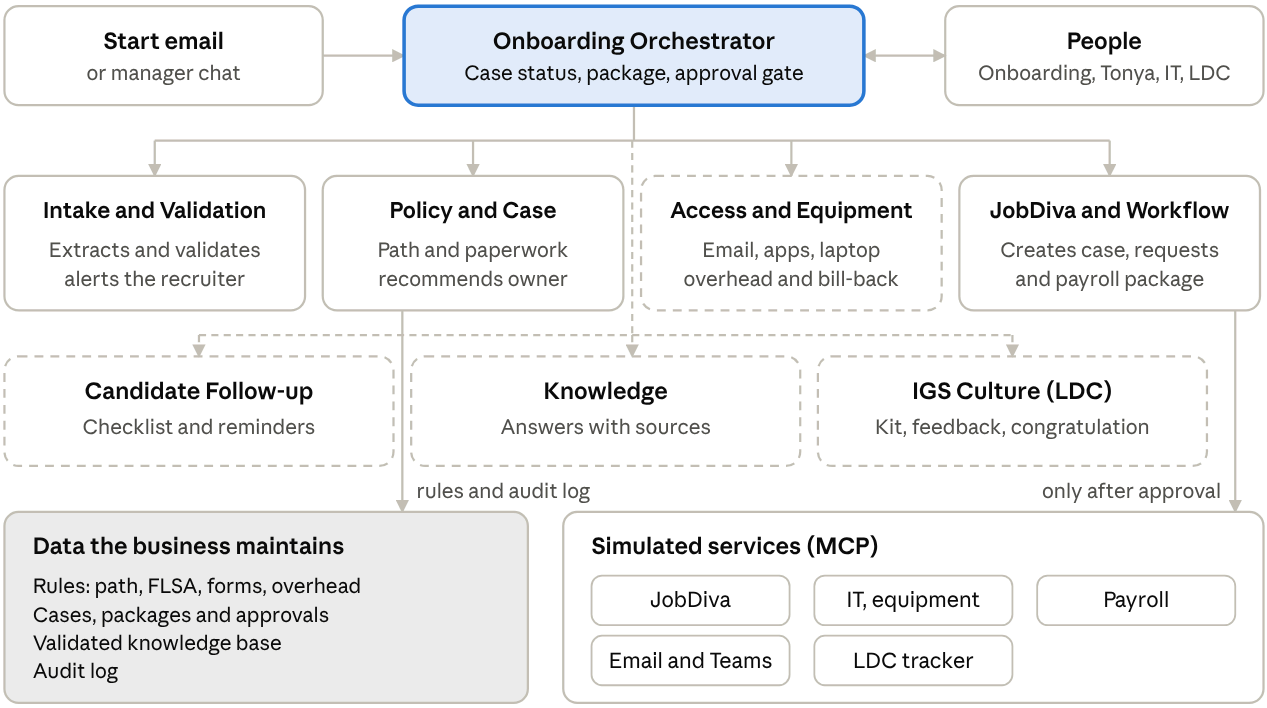

The approver can tell at a glance what came from a source, what the Coworker recommends and what is still open. An open exception, such as bill-back with no client rule, is visible before approval.

5. Solution design

To users, the Coworker is a single agent with several touchpoints (email, chat and notifications) that proposes drafts and keeps JobDiva updated at each stage. Inside, an Onboarding Orchestrator owns the case and splits the work across specialized agents that share the same context; only one of them writes to the simulated systems, and only with approval. This multi-agent architecture is what the hackathon scores.

One Coworker for the user; inside, three base agents and four extensions

Solid = Must for the demo. Dashed = Should or Could. Only JobDiva and Workflow writes to systems.

Architecture · 1 orchestrator, 7 agents, 5 simulated services

Agent	Priority	Responsibility	Tools
Onboarding Orchestrator	Must	Keeps the case status, decides which agent acts, manages timing and escalations, builds the package, enforces the approval gate and answers the Onboarding Team about their candidates	Case store, audit log, notifications, JobDiva lookup
Intake and Validation	Must	Reads the email or chat, extracts the fields, checks completeness and consistency, asks for what is missing and checks for duplicates	Mailbox (mock), JobDiva search (mock)

Agent	Priority	Responsibility	Tools
Policy and Case Setup	Must	Applies the rule engine: path, agreement by FLSA, forms by state, city and client; recommends the owner; escalates unclear cases to the Onboarding Team	Rules catalog
JobDiva and Workflow	Must	After approval, creates the JobDiva case and updates it at each stage; creates requests, the task list and the payroll package	JobDiva, IT, equipment and payroll mocks
Access and Equipment	Should	Recommends email, Teams, apps and equipment; computes overhead and bill-back; drafts the Chelsea Tech request	Access and equipment catalogs
Candidate Follow-up	Should	Sends the checklist, tiered reminders and correction requests; verifies what was delivered	Notifications (mock), checklist
Onboarding Knowledge	Should	Answers process questions from validated records and cites the source; proposes drafts and logs unresolved questions	Knowledge base
Culture and Belonging (IGS)	Could	Logs the hire in the LDC tracker, assigns the kit, schedules feedback and drafts the congratulation	LDC list (mock), notifications

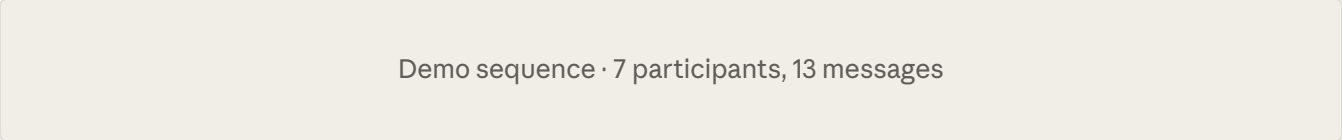

Notifications (email and Teams) are a shared tool with templates per audience, not a separate agent. The demo shows at least three specialized agents collaborating on one case: Intake, Policy and JobDiva, coordinated by the orchestrator; Access and Equipment joins if S1 is ready.

Case states

Each case moves through explicit states; states that need a person are marked.

Demo sequence

6. Data, tools, integrations and simulated services

Every enterprise system is a simulated service (mock) exposed as a tool or MCP server; business rules and knowledge live as data the business maintains, not in code.

Integrations

System	Use in the Coworker	In the hackathon	Agent using it
Velocity 2.0	Agent runtime, orchestration and models	Real (mandatory)	All
JobDiva	Search starts (duplicates), create the case, read activated documents and status	API mock by default; sandbox read-only if API credentials are obtained	Intake, JobDiva and Workflow
Onboarding mailbox (Outlook)	Read the start email, send notifications	Mock with synthetic emails	Intake, notifications
Microsoft Teams	Alerts to owners, IT and LDC; optional chat channel	Mock	Notifications

System	Use in the Coworker	In the hackathon	Agent using it
IT and equipment (Chelsea Tech)	Access and laptop requests approved by IT	Mock; never real orders	Access and Equipment, JobDiva and Workflow
Payroll (Paychex)	Receive the package and return issues	Mock	JobDiva and Workflow
LDC tracker (SharePoint)	Hire log, kit and feedback	List mock; owner: the LDC team	Culture and Belonging
Knowledge base	Validated questions, solutions and procedures	Seed data	Knowledge

Functional prototype and channels

The demo runs in a lightweight local web app connected to the orchestrator on Velocity 2.0; it is the only mandatory channel and depends on no outside permissions.

Functional prototype · 1 web app, 5 views, Teams optional

View	Who uses it	What it shows
Chat	Recruiter and Onboarding Team	The conversational intake and status questions (“how are my candidates doing?”)
Simulated email inbox	Demo	Synthetic start emails; a button simulates a new one arriving
Approval	Tonya Ramirez	The package with sources and the Approve, Return and Reject buttons
Simulated alerts	Everyone	The notifications that would go through Teams or email in production
Status	Onboarding Team and reviewers	The case in the JobDiva mock, the requests and the audit log

Team decisions: Velocity 2.0 has no chat interface of its own, so we build the web app. Nobody on the team has permission today to register a bot in the INSPYR tenant; the Teams integration is optional if permissions are obtained, and only after the demo is stable. In the pilot, the same orchestrator connects to Teams and the real onboarding mailbox without changing the agents.

JobDiva integration and authentication

The demo uses the JobDiva mock; the real sandbox is an optional read-only mode, switched on by an environment variable if we get API credentials in time.

- **One connector, two modes.** The agents always call the same JobDiva connector (MCP server). `JOBDIVA_MODE=mock` (default) creates and updates the case with synthetic data; `JOBDIVA_MODE=sandbox` only reads: a test candidate's start, its start notes and the duplicate search. The Coworker never writes to JobDiva, not even in the sandbox.
- **API authentication, not the web login.** A user login to the sandbox web interface does not work for the Coworker. The API needs the account's Client ID (issued by JobDiva support), a dedicated API user (created by an admin with the "Only allow access to JobDiva API Calls" permission) and its password; these return a token that is renewed when it expires. Based on integrator guides; to be confirmed with JobDiva.
- **Secrets.** `JOBDIVA_BASE_URL`, `JOBDIVA_CLIENT_ID`, `JOBDIVA_API_USER` and `JOBDIVA_API_PASSWORD` go in a local `.env` outside the repository; the repository only ships `.env.example` with the names. The token lives in memory and is never written to the audit log.
- **Manual use of the sandbox.** The team's web access is used to copy the real start form fields, export test start emails for the simulated inbox and review the document packages that feed the rules catalog.

Pending: ask Tonya Ramirez or the account admin to have JobDiva enable the API on the sandbox and create the API user, and confirm read-only sandbox use with the committee. If there are no credentials by October 16, the demo continues with the mock only.

Data model

Entity	Main fields
Onboarding case	ID, person, role, client, division, location, contract type, FLSA, sponsorship, owner, status, dates, package version

Entity	Main fields
Package line	Case, field, value, label (source, inferred, recommended, exception), source or rule ID
Approval	Case, version, approver, decision, comment, date
Document checklist	Case, document, required by (client, location, contract), status, date
Business rule	ID, type (contract to kit, client to documents, location to documents, contract or client to owner, equipment to overhead), condition, result, owner
Cultural follow-up	Person, leader, start, kit, feedback date, status, congratulation
Knowledge record	ID, type, title, description, answer, steps, category, tags, status, source, date
Audit log	Action, agent, case, date, data and rules used

Seed data: path and form rules (for example California, Philadelphia, and Texas with no state forms), 2% and 5% overhead, access catalog, and synthetic W-2, contractor and corp-to-corp scenarios with gaps, contradictions and a duplicate.

Onboarding knowledge module

It preserves operational knowledge so that, if the onboarding owner leaves, someone else can ask the Coworker for the questions, solutions and procedures already documented. The repository grows with every resolved case, without documenting the whole process up front.

Knowledge module · functional flow

Operation	Purpose
searchKnowledge / getKnowledge	Find and retrieve validated records, citing the source
createKnowledge / updateKnowledge	Log or enrich a question, problem or procedure

Operation	Purpose
submitForValidation / validateKnowledge	Send for validation and record the owner's decision
registerUnresolved	Keep an unanswered question pending
getKnowledgeHistory	See a record's versions, dates and change origin

Agreed decision. The agent proposes drafts when it has the context, marked as unvalidated; the right person for the case approves them before they are presented as confirmed (RN-03 and RN-04).

7. Governance, acceptance criteria, risks and plan

People keep every decision that creates a record, grants access, spends money or touches employment law; the Coworker prepares, recommends, cites and logs.

Governance model

Control	How it is enforced
Approval gate	Tools that write to systems run only with an approval ID for the current package version
No legal decisions	FLSA, classification and compensation come from the field or HR; the Coworker only maps them to paperwork and escalates conflicts to the Onboarding Team
Rules owned by the business	Onboarding, IT and LDC maintain the rules as data, with an owner and a version
Traceability	Each data point carries its label (source, inferred, recommended, exception) and each action is in the audit log
Sensitive data	Visa, sponsorship and FLSA restricted by role; never in messages to leaders or mass communications
Duplicate prevention	A request or case with the same person and date is searched for before continuing

Control	How it is enforced
Data and secrets	Synthetic data only, no production connections, no credentials in the repository
Message cadence	Reminders with configurable frequency and a send limit
Cost	Model use within the assigned budget and logged per run

Seven human checkpoints: the recruiter corrects the flagged data; the Onboarding Team confirms the case and owner and resolves process escalations; the Consultant Onboarding Supervisor (Tonya Ramirez) approves the package; IT approves the laptop; onboarding approves the payroll handoff; LDC approves the welcome kit and feedback; the right person for the case validates new knowledge.

Acceptance criteria

#	Criterion	Priority
AC1	Given an email with a missing or inconsistent field, the recruiter gets an alert naming the exact field	Must
AC2	The intake collects 100% of the scenario's mandatory data without questions outside the path	Must
AC3	Given a client, location and contract, the paperwork and owner match the configured rules	Must
AC4	Equipment and its overhead match the provider (2% or 5%) and the laptop is not requested without IT approval	Should
AC5	The package is ready in 5 minutes or less after the last answer and every line cites its source	Must
AC6	No action on simulated systems happens without approval of the current package version	Must
AC7	A duplicate request is blocked	Must

#	Criterion	Priority
AC8	At least three specialized agents (Intake, Policy and JobDiva) collaborate on the same case, coordinated by the orchestrator	Must
AC9	Every agent action is in the audit log	Must
AC10	If the candidate misses a deadline they get a reminder and, past the threshold, the owner gets an alert	Should
AC11	The knowledge agent answers with the record reference or leaves the question pending; it never presents unvalidated content as confirmed	Should
AC12	Closing the onboarding creates the LDC tracker entry with the kit by contract, and the congratulation needs LDC approval	Could

Key risks

Preliminary team assessment; the biggest risk is the timeline.

Risk matrix · 11 risks, preliminary assessment

#	Risk	Mitigation
R1	8 days to build and test	Build J1 and J2 end to end first; Should and Could only with a stable demo
R2	Velocity 2.0 learning curve or licenses	Confirm licenses on October 15; a minimal case working on day one
R3	Tacit business rules (forms, overhead, bill-back)	Validate the rules catalog with Tonya Ramirez's team; cite rule IDs
R4	Recruiting emails with no standard format	The agent tolerates variations and asks for confirmation; propose a template
R5	Extraction errors affecting payroll or classification	Mandatory human validation; no autonomous decisions

#	Risk	Mitigation
R6	Exposure of visa, sponsorship or FLSA	Role-based permissions and data minimization in messages
R7	Too many reminders to candidates or leaders	Configurable cadence and a send limit
R8	Model cost overrun	Small models for extraction, usage logged per run
R9	Low adoption by the teams	Co-design with onboarding and LDC; the Coworker assists, it does not replace
R10	Demo failure on presentation day	Preloaded scenarios and a backup video
R11	JobDiva API credentials not available in time	JobDiva mock as the default mode; the sandbox is enabled only if credentials arrive before October 16

Implementation plan

Hackathon plan · October 14 to 22, 2026

October 16 is the key cutoff: if Velocity 2.0, the database and the mocks are not ready, the extensions are dropped and all time goes to J1 and J2.

Phase	Scope	Result
Hackathon (until October 22)	Journeys J1 and J2 with mocks; J3, knowledge and IGS if time allows	End-to-end demo, repository, README, presentation and video
Pilot (4 to 6 weeks)	One client or contract type, real onboarding mailbox, real JobDiva integration	Measurement against the 3-day baseline
Scale-up	All clients, full document verification, full IGS flow and analytics	Stable operation and continuous improvement
